6.6. <i>Pentachlorophenol</i>	58
-------------------------------	----

## LIST OF ACRONYMS

ABS	Absorption factor
AI	Aluminum content
BCF	Bioconcentration factor
BTEXS	benzene, toluene, ethylbenzene, styrene
BTf	Biotransfer factor
Da	Diffusion coefficient in air
Dpe	Diffusion coefficient in polyethylene
Dpvc	Diffusion coefficient in PVC
Dw	Diffusion coefficient in water
FA	Factor used when calculating dermal absorption from water
Fe	Iron content
K <sub>d</sub>	Sorption coëfficient soil-water
K <sub>oa</sub>	Distribution coefficient octanol-air
K <sub>oc</sub>	Distribution coefficient organic carbon-water
K <sub>ow</sub>	Distribution coefficient octanol-water
K <sub>p</sub>	Dermal permeability coefficient
MTBE	methyl-t-butylether
OVAM	Openbare Vlaamse Afvalstoffenmaatschappij (Public Waste Agency of Flanders)
PAK	polycyclic aromatic hydrocarbons
Ptot	Total phosphorus content
TCL	Tolerable Concentration in Air
TDI	Tolerable Daily Intake
TGD	Technical Guidance Document
VMM	Vlaamse MilieuMaatschappij (Flanders Environment Agency)

## LIST OF MODIFICATIONS

28/09/2016	The CAS number for trichloroethylene was corrected
12/01/2017	The CAS number of monochlorobenzene was corrected
07/02/2017	Typos corrected
15/05/2019	Update of substance data dichloromethane, tetrachloromethane, tetrachloroethylene, trichloroethylene and 1,1,1-trichloroethane and update of 'introduction'

## INTRODUCTION

The substance data sheets summarise the data as available in S-Risk 1.0. The substance data sheets are a copy of those used for the calculation of the proposed soil clean-up values in Flanders. Following changes in model equations in S-Risk compared to the formerly used Vlier-Humaan model, some new parameter values had to be introduced. Also some supplementary options available in S-Risk required changes to the input data for which new values had to be collected. The most important changes are;

- **Dermal absorption:** Two new parameters are used that replace the formerly used parameters to calculate dermal absorption, namely the fraction adsorbed for dermal uptake via soil and dust, and the dermal permeability coefficient for dermal uptake from water. The latter parameter is combined with a parameter FA.
- **Bioconcentration factors plants (BCF):** For metals and arsenic very often either the BCF for maize or the BCF for grass was missing. In these cases the same BCF was used for maize and grass. Because this is incorrect, there is a need to search for additional BCFs.
- **Bioconcentration factors plants (BCF):** for organic compounds plant uptake in S-Risk can either be calculated starting from substance- and plant-specific characteristics or directly from BCF values expressed in mg/kg dm in the plant per mg/m<sup>3</sup> soil solution. For most organic substances plant uptake is calculated. For some organic substances however, BCF values reported in the original (Vlier-Humaan) data sheets had units of mg/kg dm in the plant per mg/kg dm in the soil, which are incompatible with the current S-Risk version. For these substances plant- and substance specific characteristics were used to calculate plant uptake. If so, this is mentioned in the data sheets.
- **Biotransfer factors animal products (BTF):** S-Risk allows to specify BTF animal products by meat, milk, kidney and liver. For inorganic substances BTF values need to be filled in. The original data sheets only provided values for meat and milk. Lacking values were collected from De Raeymaecker et al. (2005). For organic substances model calculations are always used to obtain BTF values.
- **Biotransfer factors eggs (BTF):** S-Risk allows the user to calculate transfer to chicken eggs. This is a new feature as compared to Vlier-Humaan. However, using default settings in S-Risk this exposure route is not activated. For metals, dichloromethane, tetrachloromethane, tetrachloroethylene, trichloroethylene and 1,1,1-trichloroethane biotransfer factors to eggs have been collected and are included in the substance data sheets. For organic substances no BTF have been collected and their value has been equaled to zero. When the exposure route to eggs is activated in S-Risk the user should enter appropriate BTF values.
- **Toxicity data:** The toxicity data in S-Risk are copied from the original substance data sheets. In contrast to Vlier-Humaan, where calculations were only possible for systemic effects and either carcinogenic or non-carcinogenic effects, S-Risk allows to make calculations for several endpoints simultaneously. As a consequence, the toxicity data in the current substance data sheets are sometimes more extensive than in the former ones.
- **Background exposure and background concentrations:** Vlier-Humaan did only allow to enter one value for background exposure (be it depending on the type of land use) via food. In S-Risk it is possible to enter age-dependent background exposure via food. Default ratios are most often used for age-dependency (according to the ratio's specified in the TGD). Differences between land-uses are taken into account based on the background concentrations for food that have been entered. S-Risk also separately calculates background exposure via drinking water.

- **Limit values for food:** For some substances calculated concentrations in food stuffs have to comply with existing standards. With this in mind recent legislation has been scrutinised and obsolete values were replaced by more recent ones when appropriate.

The existing information, which was copied in S-Risk is based on the following original substance data sheets:

- Heavy metals: OVAM (2009c) and (OVAM, 2009d) with accompanying spreadsheet;
- BTEXs: OVAM (2009a);
- Chlorinated aliphatic substances: OVAM (2004) for 1,1,2-trichloroethane, 1,1-dichloroethane, cis-1,2-dichloroethene, trans-1,2-dichloroethene; Van Holderbeke, Geerts, Bierkens, and Cornelis (2019) for 1,1,1-trichloroethane, dichloromethane, tetrachloroethylene, tetrachloromethane, trichloroethylene; OVAM (2009b) for 1,2-dichloroethane, vinyl chloride, trichloromethane (chloroform);
- Chloro-aromatics: OVAM (2004); OVAM (2009b) for hexachloro-benzene;
- PAHs: OVAM (2003a) for PAHs; OVAM (2005a) for changes in the evaluation criteria for benzo(a)pyrene and dibenz(a,h)antracene;
- Cyanides: OVAM (2004);
- Trimethylbenzenes: OVAM (2003b);
- Chlorophenols: OVAM (2005b)
- Hexane, heptane, octane: OVAM (2004);
- MTBE: OVAM (2003a)

Details on the new information is always available in the report discussing the calculation of clean-up values with S-Risk (Cornelis, Bierkens, & Standaert, 2013). Newly added or modified information compared to the original data sheets is clearly indicated in the S-Risk substance data sheets.

The substance data sheets consist of 6 documents:

- Part 1: Substance data sheets metals and arsenic
- Part 2: Substance data sheets benzene, toluene, ethylbenzene, xylenes, styrene and trimethylbenzenes
- **Part 3: Substance data sheets chlorinated aliphatic substances, chlorobenzenes and chlorophenols**
- Part 4: Substance data sheets polycyclic aromatic hydrocarbons
- Part 5: Substance data sheets alkanes, MTBE and cyanides
- Part 6: Substance data sheets total petroleum hydrocarbons

**CHAPTER 4. SUBSTANCE DATA SHEETS CHLORINATED ALIPHATIC SUBSTANCES**

Data on substances that do not derive from the former substance data sheets are indicated with  accompanied with some explanation if appropriate. Detailed information on all new entries is given in Cornelis et al. (2013).

As the chlorinated aliphatics have been assessed in multiple background documents, the applicable report by chemical is listed below.

Chemical name	Report
Dichloromethane	Van Holderbeke, Geerts, Bierkens, and Cornelis (2019)
Tetrachloromethane	Van Holderbeke, Geerts, Bierkens, and Cornelis (2019)
Tetrachloroethylene	Van Holderbeke, Geerts, Bierkens, and Cornelis (2019)
Trichloroethylene	Van Holderbeke, Geerts, Bierkens, and Cornelis (2019)
1,1,1-trichloroethane	Van Holderbeke, Geerts, Bierkens, and Cornelis (2019)
1,1,2-trichloroethane	Nouwen and Cornelis (1998)
1,1-dichloroethane	Nouwen and Cornelis (1998)
c-1,2-dichloroethene	Nouwen and Cornelis (1998)
t-1,2-dichloroethene	Nouwen and Cornelis (1998)
1,2-dichloroethane**	De Raeymaecker et al. (2003)
vinylchloride	De Raeymaecker et al. (2003)
trichloromethane	De Raeymaecker et al. (2003)

\*: toxicology under review

\*\*: important remarks given in the substance data sheet

## 4.1. DICHLOROMETHANE

Parameter	Unit	Value	Source
CAS nr.		75-09-2	
Type		organic	
Dissociating		no	
Molecular weight	g/mol	85	
Solubility	mg/l	$1.99 \times 10^4$ (25°C)	Kühne et al. (1995)
	Pa	57662 (25°C)	Average of experimental data and calculated with Antoine equation
Vapour pressure			
Henry coefficient	Pa m <sup>3</sup> /mol	134 (10°C)	Regression from Warneck (2007)
log Kow	g/g	1.3 ( $K_{ow} = 20$ )	Average of experimental and QSAR data
log Koc	dm <sup>3</sup> /kg	calculated	Calculated in S-Risk (hydrophobic chemical)
Log Koa	g/g	calculated	N
BCF		calculated	
Dpe	m <sup>2</sup> /d	$5 \times 10^{-7}$	van den Berg (1994)
Dpvc	m <sup>2</sup> /d	calculated	
Diffusion coefficient air (Da)	m <sup>2</sup> /d	calculated	
Diffusion coefficient water (Dw)	m <sup>2</sup> /d	calculated	
Kp	[cm/h]	calculated	N
FA	-	1	N
ABS dermal soil/dust	-	0	N negligible, volatile chemical
BTF beef	d/kg	calculated	
BTF mutton	d/kg	calculated	N
BTF liver	d/kg	calculated	N
BTF kidney	d/kg	calculated	N
BTF milk	d/kg	calculated	
BTF soil – egg	d/kg	0.33	Leeman et al. (2007)
BTF feed - egg	d/kg	0.33	Leeman et al. (2007)
Carcinogenicity		2A	IARC (2014)
Systemic effects threshold			
TDI oral	mg/kg.d	$6 \times 10^{-3}$	WHO (2003), US-EPA (2011)
TCL inhalation	mg/m <sup>3</sup>	$6 \times 10^{-1}$	US-EPA (2011)
TDI dermal	mg/kg.d	$6 \times 10^{-3}$	same as oral TDI
averaging period		child, adolescent, adult	
Carcinogenicity (unit risk)			
Oral slope factor	(mg/kg.d) <sup>-1</sup>	$2 \times 10^{-3}$ (adult) $6 \times 10^{-3}$ (3 - < 15 yr) $2 \times 10^{-2}$ (1 - < 3 yr)	US-EPA (2011) <sup>a)</sup>
Inhalation unit risk	(mg/m <sup>3</sup> ) <sup>-1</sup>	$1 \times 10^{-5}$ (volw) $3 \times 10^{-5}$ (3 - < 15 yr) $1 \times 10^{-4}$ (1 - < 3 yr)	US-EPA (2011) <sup>a)</sup>

Parameter	Unit	Value	Source
Dermal slope factor	(mg/kg.d) <sup>-1</sup>	$2 \times 10^{-3}$ (adult) $6 \times 10^{-3}$ (3 - < 15 yr) $2 \times 10^{-2}$ (1 - < 3 yr)	= Oral slope factor
averaging period		lifelong	
Local effects threshold			
inhalation	(mg/m <sup>3</sup> )	$4,5 \times 10^{-1}$	WHO (2000)
averaging period		child, adolescent, adult	
Limit value in air	mg/m <sup>3</sup>	0.45	WHO (2000) <sup>b)</sup> , toxicological reference value
Limit value in drinking water	mg/m <sup>3</sup>	20	WHO (1993)
Limit value in plants	mg/kg fw	-	
Limit value in meat			
Beef	mg/kg fw	-	
Mutton	mg/kg fw	-	
Liver	mg/kg fw	-	
Kidney	mg/kg fw	-	
Milk	mg/kg fw	-	
Butter	mg/kg fw	-	
Egg	mg/kg fw	-	
Dietary background adults	mg/kg day	0	
Dietary background children	mg/kg.day	0	
Background potatoes	mg/kg fw	0	
Background root crops	mg/kg fw	0	
Background bulbous plants (onion ...)	mg/kg fw	0	
Background fruit vegetables	mg/kg fw	0	
Background cabbage	mg/kg fw	0	
Background leafy vegetables	mg/kg fw	0	
Background legume	mg/kg fw	0	
Background beef	mg/kg fw	0	
Background offal	mg/kg fw	0	
Background milk	mg/kg fw	0	
Background butter	mg/kg fw	0	
Background eggs	mg/kg fw	0	
Background outdoor air	mg/m <sup>3</sup>	0	no values
Background indoor air	mg/m <sup>3</sup>	0	 no values
Background drinking water	mg/m <sup>3</sup>	0.1	VROM (2010)

a) Because the studies do not include early life stages, US-EPA proposes to multiply the unit risk and the slope factor by age dependent factors (factor 10 for <2 years, factor 3 for 2-<16 years and factor 1 for ≥ 16 years) to take into account the possible increased sensitivity during childhood.

b) The lifelong slope factor for inhalation is  $1.7 \cdot 10^{-5}$  (mg / m<sup>3</sup>)<sup>-1</sup> (US-EPA, 2011). Converted to an extra lifelong cancer risk of  $1 \cdot 10^{-5}$ , this results in a concentration of 0.60 mg / m<sup>3</sup>. The value based on the formation of COHb (0.45 mg / m<sup>3</sup>) is lower and is therefore selected.

## 4.2. TETRACHLOROMETHANE

Parameter	Unit	Value	Source
CAS nr.		56-23-5	
Type		organic	
Dissociating		no	
Molecular weight	g/mol	154	
Solubility	mg/l	775 (25°C)	Average of experimental data
	Pa	14991 (25°C)	Average of experimental data and calculated with Antoine equation
Vapour pressure			
Henry coefficient	Pa m <sup>3</sup> /mol	1310 (10°C)	Regression, Warneck (2007)
log Kow	g/g	2.66 ( $K_{ow} = 457$ )	Average of experimental data

#### 4.8. 1,2-DICHLOROETHANE

! The toxicological data that have been used in the calculation of the clean-up values and the data that were used in Vlier-Humaan differ significantly with regard to 1,2-dichloroethane. The data used in Vlier-Humaan and listed in the original data sheet result in higher risks. The footnote to the below substance data sheet gives further clarification. At present, it is clear that 1,2-dichloroethane should be considered a carcinogen by all routes of exposure. An evaluation of the most recent toxicological data is required.

a) When calculating the clean-up values, a toxicological reference value for oral carcinogenicity and inhalation non-carcinogenicity was used for 1,2-dichloroethane. The chemical was considered a carcinogen, which means that lifelong exposure was calculated. To fill this in the S-Risk data format, 1,2-dichloroethane is entered as a systemic carcinogen without threshold with a very low slope factor for the inhalation route (dummy value). Consequently, the oral and dermal route are accounted for in the carcinogenic effects and the inhalation route contributes only to a negligible extent. With regard to inhalation, local effects are considered as well, with the toxicological reference value from the calculation of the clean-up values. The limit in air corresponds to the value for non-carcinogenic effects.

Vlier-Humaan and the associated data sheet (part of the current ‘Basisinformatie voor risico-evaluaties’ – version 2014) list the data at which 1,2-dichloroethane is considered a carcinogen by all exposure routes. If these data would be copied, this would give following S-Risk input:

- Oral systemic without threshold: 0.01 (mg/kg.d)<sup>-1</sup>
- Inhalation systemic without threshold: 2.6.10<sup>-2</sup> (mg/m<sup>3</sup>)<sup>-1</sup>
- Dermal systemic without threshold: 0.01 (mg/kg.d)<sup>-1</sup> (oral absorption factor: 1)

Limiet in air : 4.10<sup>-4</sup> mg/m<sup>3</sup>

Limiet in drinking water: 30 mg/m<sup>3</sup>

b) The original substance data sheet lists the reference values for carcinogenic non-threshold effects as a dose corresponding to an excess lifelong cancer risk of 1/10<sup>5</sup>. S-Risk uses slope factors and unit risks. Conversion is as follows: slope factor ((mg/kg.d)<sup>-1</sup>) = 1.10<sup>-5</sup>/(dose at 1.10<sup>-5</sup> (mg/kg.d)). In case of inhalation risks, the dose is first converted to a concentration by multiplying it with 70 kg (body weight) and dividing it by 20 m<sup>3</sup>/d (inhalation rate).

- a) Vinylchloride is a human carcinogen by all exposure routes. The carcinogenic effect is the most critical effect and was used to calculate the soil remediation values. In addition to the carcinogenic reference values, the S-Risk data sheet also provides the reference values for the non-carcinogenic effects of vinylchloride that were referenced in the background document to the soil remediation values.
- b) The original substance data sheets express the reference value for inhalation in units of mg/kg.d. S-Risk uses a reference value in units of mg/m<sup>3</sup>. Conversion can be done by multiplying the value in mg/kg.d with a body weight of 70 kg and an inhalation rate of 20 m<sup>3</sup>/d.
- c) The original substance data sheet lists the reference values for carcinogenic non-threshold effects as a dose corresponding to an excess lifelong cancer risk of 1/10<sup>5</sup>. S-Risk uses slope factors and unit risks. Conversion is as follows: slope factor ((mg/kg.d)<sup>-1</sup>) = 1.10<sup>-5</sup>/(dose at 1.10<sup>-5</sup> (mg/kg.d)). In case of inhalation risks, the dose is first converted to a concentration by multiplying it with 70 kg (body weight) and dividing it by 20 m<sup>3</sup>/d (inhalation rate).

- a) Trichloromethane is a human genotoxic carcinogen by all exposure routes. The carcinogenic effect is the most critical effect and was used to calculate the soil remediation values. In addition to the carcinogenic reference values, the S-Risk data sheet also provides reference values for the non-carcinogenic effects of vinylchloride. These values were selected from the values referenced in the background document to the soil remediation values.
- b) The original substance data sheets express the reference value for inhalation in units of mg/kg.d. S-Risk uses a reference value in units of mg/m<sup>3</sup>. Conversion can be done by multiplying the value in mg/kg.d with a body weight of 70 kg and an inhalation rate of 20 m<sup>3</sup>/d.
- c) The original substance data sheet lists the reference values for carcinogenic non-threshold effects as a dose corresponding to an excess lifelong cancer risk of 1/10<sup>5</sup>. S-Risk uses slope factors and unit risks. Conversion is as follows: slope factor ((mg/kg.d)<sup>-1</sup>) = 1.10<sup>-5</sup>/(dose at 1.10<sup>-5</sup> (mg/kg.d)). In case of inhalation risks, the dose is first converted to a concentration by multiplying it with 70 kg (body weight) and dividing it by 20 m<sup>3</sup>/d (inhalation rate).

**CHAPTER 6. SUBSTANCE DATA SHEETS CHLOROPHENOLS**

Data on substances that do not derive from the former substance data sheets are indicated with **N**, accompanied with some explanation if appropriate. Detailed information on all new entries is given in Cornelis et al. (2013).

- a) 2,4,6-Trichlorophenol is a genotoxic carcinogen by all exposure routes and the carcinogenic reference values were used when calculating soil remediation values. These data were taken over in the S-Risk substance data sheet. In addition to this, data for the non-carcinogenic effects of 2,4,6-trichlorophenol were searched for and added to the S-Risk substance data sheet.
- b) The original substance data sheets express the reference value for inhalation in units of mg/kg.d. S-Risk uses a reference value in units of mg/m<sup>3</sup>. Conversion can be done by multiplying the value in mg/kg.d with a body weight of 70 kg and an inhalation rate of 20 m<sup>3</sup>/d.
- c) The original substance data sheet lists the reference values for carcinogenic non-threshold effects as a dose corresponding to an excess lifelong cancer risk of 1/10<sup>5</sup>. S-Risk uses slope factors and unit risks. Conversion is as follows: slope factor ((mg/kg.d)<sup>-1</sup>) = 1.10<sup>-5</sup>/(dose at 1.10<sup>-5</sup> (mg/kg.d)). In case of inhalation risks, the dose is first converted to a concentration by multiplying it with 70 kg (body weight) and dividing it by 20 m<sup>3</sup>/d (inhalation rate).
